Approximation of solutions to fractional integral equation

M. Muslim a,∗, Carlos Conca a, A.K. Nandakumaran b

Abstract

In this paper we shall study a fractional integral equation in an arbitrary Banach space X. We used the analytic semigroups theory of linear operators and the fixed point method to establish the existence and uniqueness of solutions of the given problem. We also prove the existence of global solution. The existence and convergence of the Faedo–Galerkin solution to the given problem is also proved in a separable Hilbert space with some additional assumptions on the operator A. Finally we give an example to illustrate the applications of the abstract results.

1. Introduction

We consider the following fractional integral equation in a Banach space (X, ||.||):

\[ u(t) = u_0 + \frac{1}{\Gamma(\beta)} \int_0^t (t-\theta)^{\beta-1}(-Au(\theta))d\theta + \frac{1}{\Gamma(\beta)} \int_0^t (t-\theta)^{\beta-1}f(\theta, u(\theta))d\theta, \quad t \in (0, T) \]  (1.1)

where A is a closed linear operator defined on a dense set and 0 < \beta < 1, 0 < T < \infty. We assume \(-A\) is the infinitesimal generator of an analytic semigroup \(S(t) : t \geq 0\) in X and the nonlinear map f is defined from \([0, T] \times X\) into X satisfying certain conditions to be specified later.

Regarding earlier works on the existence and uniqueness of different types of solutions to fractional integral and differential equations, we refer to [1–6] and references cited in these papers.

Muslim [1] has considered the following fractional order integral equations in a Banach space X of the form

\[ u(t) = u_0 + \frac{1}{\Gamma(\beta)} \int_0^t (t-\theta)^{\beta-1}(-Au(\theta))d\theta + \frac{1}{\Gamma(\beta)} \int_0^t (t-\theta)^{\beta-1}f_1(\theta, u(\theta))d\theta, \quad t \in (0, T) \]  (1.2)

and

\[ u(t) = u_0 + \frac{1}{\Gamma(\beta)} \int_0^t (t-\theta)^{\beta-1}(-Au(\theta))d\theta + \frac{1}{\Gamma(\beta)} \int_0^t (t-\theta)^{\beta-1}f_2(\theta, u(\theta), u(a(\theta)))d\theta, \quad t \in (0, T) \]  (1.3)

where \(-A\) is the infinitesimal generator of a compact analytic semigroup and proved the existence and uniqueness of local solutions.

Initial studies concerning the existence, uniqueness and finite-time blow-up of solutions for the following equation

\[ u'(t) + Au(t) = g(u(t)), \quad t \geq 0, \]
\[ u(0) = \phi, \quad \]  (1.4)

have been considered by Segal [7], Murakami [8] and Heinz and von Wahl [9]. Bazley [10,11] has considered the following semilinear wave equation
\[ u''(t) + Au(t) = g(u(t)), \quad t \geq 0, \]
\[ u(0) = \phi, \quad u'(0) = \psi, \tag{1.5} \]
and has established the uniform convergence of approximate solutions to Eq. (1.5) by using the existence results of Heinz and von Wahl [9]. Goethel [12] has proved the convergence of approximate solutions to the problem (1.4), but assumed \( g \) to be defined on the whole of \( H \).

In this paper, we use the Banach fixed point theorem and analytic semigroup theory to prove the existence, uniqueness and approximation of solutions of the given problem (1.1). Further, we also prove certain approximation results.

The plan of the paper is as follows. In Section 3, we prove the existence and uniqueness of local solutions and in Section 4, the existence of global solution for the problem (1.1) is given. Section 5 deals with the approximation of solutions. In the last section, we have given an example.

2. Preliminaries

We note that if \(-A\) is the infinitesimal generator of an analytic semigroup then for \( c > 0 \) large enough, \(-(A + ct)\) is invertible and generates a bounded analytic semigroup. This allows us to reduce the general case in which \(-A\) is the infinitesimal generator of an analytic semigroup to the case in which the semigroup is bounded and the generator is invertible. Hence, without loss of generality we suppose that
\[ \|S(t)\| \leq M \quad \text{for} \quad t \geq 0 \]
and
\[ 0 \in \rho(-A), \]
where \( \rho(-A) \) is the resolvent set of \(-A\). It follows that for \( 0 \leq \alpha \leq 1 \), \( A^\alpha \) can be defined as a closed linear invertible operator with domain \( D(A^\alpha) \) being dense in \( X \). We have \( X_\alpha \hookrightarrow X_\kappa \) for \( 0 < \alpha < \kappa \) and the embedding is continuous. For more details on the fractional powers of closed linear operators we refer to Pazy [13]. It can be proved easily that \( X_\alpha := D(A^\alpha) \) is a Banach space with norm \( \|x\|_\alpha = \|A^\alpha x\| \) and it is equivalent to the graph norm of \( A^\alpha \).

We notice that \( C_T = C([0, T], X) \), the set of all continuous functions from \([0, T]\) into \( X \) is a Banach space under the supremum norm given by
\[ \|\psi\|_T := \sup_{0 \leq \eta \leq T} \|\psi(\eta)\|, \quad \psi \in C_T. \]
It can also be proved easily that \( C_T^\alpha = C([0, T]; X_\alpha) \), for all \( t \in [0, T] \), is a Banach space endowed with the supremum norm
\[ \|\psi\|_{T, \alpha} := \sup_{0 \leq \eta \leq T} \|\psi(\eta)\|_\alpha, \quad \psi \in C_T^\alpha. \]

We assume the following conditions:
(A1) \(-A\) is the infinitesimal generator of an analytic semigroup \( S(t) \).
(A2) The nonlinear map \( f : [0, T] \times X_\alpha \to X \) satisfies
\[ \|f(t, x) - f(s, y)\| \leq L(r)[|t - s|^r + \|x - y\|_\alpha], \]
for all \( t, s \in [0, T] \), a fixed \( v \), \( 0 < v \leq 1 \) and \( x, y \in B_r(X_\alpha) \), where \( L : \mathbb{R}_+ \to \mathbb{R}_+ \) is a nondecreasing function and for \( r > 0 \)
\[ B_r(Z) = \{z \in Z : \|z\| \leq r\}, \]
where \((Z, \|\cdot\|_Z)\) is a Banach space.

We define the Riemann–Liouville integral of order \( \beta > 0 \) by
\[ I^\beta g(t) = \frac{1}{\Gamma(\beta)} \int_0^t (t - \theta)^{\beta - 1} g(\theta) d\theta. \]

**Definition 2.1.** By a mild solution of the evolution problem (1.1), we mean a continuous solution \( u \) of the following integral equation given below
\[ u(t) = \int_0^\infty \zeta_\beta(\theta)S(\theta)u_0 d\theta + \beta \int_0^t \int_0^\infty \theta(t - s)^{\beta - 1} \zeta_\beta(\theta)S((t - s)^\beta \theta)f(s, u(s), u(a(\theta))) d\theta ds, \tag{2.1} \]
where \( \zeta_\beta(\theta) \) is the probability density function \([14,15]\).

For further detail on the mild solution, we refer to \([1,3–5]\).
3. Existence of solutions

Throughout the paper we have assumed that $0 < T < \infty$, $0 < \beta < 1$ and $0 \leq \alpha < 1$.

We have the following theorem regarding the existence of a local solution.

**Theorem 3.1.** Suppose that $-A$ is the infinitesimal generator of an analytic semigroup $S(t)$ with $\|S(t)\| \leq M$, $t \geq 0$ and that $0 \in \rho(-A)$. If the function $f$ satisfies the condition (A2) and $u_0 \in D(A)$, then the fractional integral equation (1.1) has a unique local solution.

**Proof.** We will establish the existence of a solution $u$ of Eq. (1.1) on $[0, t_0]$ for some $t_0$ such that $0 < t_0 \leq T$.

We take

$$
\int_0^\infty \theta^{1-\alpha} \zeta_\theta(\theta) \text{d}\theta = N_1,
$$

(3.1)

where $\zeta_\theta(\theta)$ is the probability density function [4].

For any $0 < T \leq t$, we define a mapping $F$ from $C^{\alpha}_{t}$ into $C^{\alpha}_{t}$ by

$$
(F\psi)(t) = \int_0^\infty \zeta_\theta(\theta) S(t^\beta \theta) u_0 \text{d}\theta + \beta \int_0^t \int_0^\infty \theta (t-s)^{\beta-1} \zeta_\theta(\theta) S((t-s)^\beta \theta) f(s, \psi(s)) \text{d}\theta \text{d}s.
$$

(3.2)

Clearly $F$ is well defined. For $R > 0$, let $M \|u_0\|_\alpha \leq \frac{R}{2}$ and

$$
S = \{u : u \in C^{\alpha}_{t}, \|u(t)\|_\alpha \leq R\}.
$$

Choose $t_0, 0 < t_0 \leq T$ such that

$$
t_0 < \left[ \frac{R}{2} C_\alpha^{-1} N_1^{-1} (1-\alpha) [L(R)(T^\nu + R) + N_2]^{-1} \right]^{1-\frac{1}{(1-\alpha)}}
$$

(3.3)

where $C_\alpha$ is a positive constant depending on $\alpha$ satisfying $\|A^\alpha S(t)\| \leq C_\alpha t^{-\alpha}$, for all $t > 0$ and $\|f(0, 0)\| = N_2$.

To prove the theorem, first we need to show that $F : S \rightarrow S$. For any $\psi \in S$, we have $(F\psi)(0) = u_0$. If $t \in [0, t_0]$ then we have

$$
\| (F\psi)(t) \|_\alpha \leq \int_0^\infty \zeta_\theta(\theta) \|S(t^\beta \theta)\| \|A^\alpha u_0\|_\alpha \text{d}\theta + \beta \int_0^t \int_0^\infty \theta (t-s)^{\beta-1} \zeta_\theta(\theta) \|A^\alpha S((t-s)^\beta \theta)\| \times \|f(s, \psi(s)) - f(0, 0)\| \text{d}\theta \text{d}s + \beta \int_0^t \int_0^\infty \theta (t-s)^{\beta-1} \zeta_\theta(\theta) \|A^\alpha S((t-s)^\beta \theta)\| \|f(0, 0)\| \text{d}\theta \text{d}s
$$

$$
\leq M \|u_0\|_\alpha + N_1 C_\alpha [L(R)(T^\nu + R) + N_2] \frac{R^{1-\alpha}}{(1-\alpha)}
$$

(3.4)

Hence $F : S \rightarrow S$. Our next goal is to show that $F$ is a strict contraction mapping on $S$.

For all $t \in [0, t_0]$ and $\psi_1, \psi_2 \in S$, we have

$$
(F\psi_1)(t) - (F\psi_2)(t) = \beta \int_0^t \int_0^\infty \theta (t-s)^{\beta-1} \zeta_\theta(\theta) S((t-s)^\beta \theta) f(s, \psi_1(s)) - f(s, \psi_2(s)) \text{d}\theta \text{d}s.
$$

Hence,

$$
\| (F\psi_1)(t) - (F\psi_2)(t) \|_\alpha \leq \beta \int_0^t \int_0^\infty \theta (t-s)^{\beta-1} \zeta_\theta(\theta) \|A^\alpha S((t-s)^\beta \theta)\| \|f(s, \psi_1(s)) - f(s, \psi_2(s))\| \text{d}\theta \text{d}s.
$$

From condition (A2) we have

$$
\| (F\psi_1)(t) - (F\psi_2)(t) \|_\alpha \leq \frac{1}{R} C_\alpha N_1 [L(R)(T^\nu + R) + N_2] \frac{R^{1-\alpha}}{(1-\alpha)} \| \psi_1 - \psi_2 \|_{1,0,\alpha}
$$

$$
\leq \frac{1}{2} \| \psi_1 - \psi_2 \|_{1,0,\alpha},
$$

for all $\psi_1, \psi_2 \in S$. Hence $F$ is a strict contraction mapping on $S$ and therefore $F$ has a unique fixed point in $S$.

Hence there exists $u \in S$, such that for all $t \in [0, t_0]$, we have

$$
u(t) = \int_0^\infty \zeta_\theta(\theta) S(t^\beta \theta) u_0 \text{d}\theta + \beta \int_0^t \int_0^\infty \theta (t-s)^{\beta-1} \zeta_\theta(\theta) S((t-s)^\beta \theta) f(s, u(s)) \text{d}\theta \text{d}s.
$$

(3.5)
where \( u(0) = u_0 \). Now we will show that the function \( u \) is Hölder continuous on \([0, t_0]\). For any \( t_1, t_2 \in [0, t_0] \), where \( t_1 < t_2 \), we have,

\[
A^\alpha[u(t_2) - u(t_1)] = \int_0^{t_2} \xi_\beta(\theta) [S(t_2^\beta \theta) - S(t_1^\beta \theta)] A^\alpha u_0 d\theta
\]

\[
+ \beta \int_{t_1}^{t_2} \int_0^{\infty} \theta (t_2 - s)^{\beta - 1} \xi_\beta(\theta) A^\alpha S((t_2 - s)^\beta \theta)f(s, u(s)) d\theta ds
\]

\[
+ (-\beta) \int_{t_1}^{t_2} \int_0^{\infty} \theta [(t_1 - s)^{\beta - 1} - (t_2 - s)^{\beta - 1}] \xi_\beta(\theta) A^\alpha S((t_2 - s)^\beta \theta)f(s, u(s)) d\theta ds
\]

\[
+ \beta \int_0^{t_1} \int_0^{\infty} \theta (t_1 - s)^{\beta - 1} \xi_\beta(\theta) A^\alpha S((t_2 - s)^\beta \theta) - S((t_1 - s)^\beta \theta)) f(s, u(s)) d\theta ds
\]

\[
= I_1 + I_2 + I_3 + I_4. \tag{3.6}
\]

Hence,

\[
\|u(t_2) - u(t_1)\|_\alpha \leq \|I_1\| + \|I_2\| + \|I_3\| + \|I_4\|. \tag{3.7}
\]

We have

\[
I_1 = \int_0^{\infty} \xi_\beta(\theta) [S(t_2^\beta \theta) - S(t_1^\beta \theta)] A^\alpha u_0 d\theta
\]

\[
= \int_0^{\infty} \xi_\beta(\theta) \left[ \int_{t_1}^{t_2} \theta \beta t^{\beta - 1} A^\alpha S(t^\beta \theta) Au_0 dt \right] d\theta.
\]

Therefore

\[
\|I_1\| \leq \int_0^{\infty} \xi_\beta(\theta) \int_{t_1}^{t_2} \theta \beta t^{\beta - 1} \|A^\alpha S(t^\beta \theta)\| \|Au_0\| dt d\theta
\]

\[
\leq C_\beta \int_0^{\infty} \theta^{1-\alpha} \xi_\beta(\theta) \int_{t_1}^{t_2} t^{\beta(1-\alpha) - 1} \|Au_0\| dt d\theta.
\]

Hence

\[
\|I_1\| \leq \frac{N_1}{(1-\alpha)} C_\alpha \|Au_0\| t_2^{\beta(1-\alpha)} - t_1^{\beta(1-\alpha)}
\]

\[
\leq C_\alpha \|Au_0\| N_1 \beta \theta (t_1 + \delta (t_2 - t_1))^{\beta(1-\alpha)-1} (t_2 - t_1)
\]

\[
\leq C_\alpha \|Au_0\| N_1 \beta \delta (1-\alpha) - 1 (t_2 - t_1)^{\beta(1-\alpha)}, \tag{3.8}
\]

where \( C_\alpha \) is some positive constant satisfying \( \|A^\alpha S(t)\| \leq C_\alpha t^{-\alpha} \) for all \( t \geq 0 \) and \( 0 < \delta < 1 \).

Also, we have

\[
\|I_2\| \leq \frac{L_f(R)}{(1-\alpha)} C_\alpha N_1 (t_2 - t_1)^{\beta(1-\alpha)}, \tag{3.9}
\]

and

\[
\|I_3\| \leq \beta N_1 L_f(R) C_\alpha \int_0^{t_1} (t_1 - s)^{\lambda - 1} \left[ (t_1 - s)^{-\lambda \mu} - (t_2 - s)^{-\lambda \mu} \right] ds, \tag{3.10}
\]

where \( L_f(R) = \{ L[R(T^+ + R)] + N_2 \} \), \( \lambda = 1 - \beta \alpha \) and \( \mu = \frac{1-\beta}{\lambda \beta \alpha} \).

Hence, after some calculation [similar to Theorem 3.2 [4]] we get

\[
\|I_3\| \leq \beta N_1 L_f(R) C_\alpha (1 - c)^{-\lambda(1-\mu)-1} (t_2 - t_1)^{\lambda(1-\mu)}, \tag{3.11}
\]

where \( c = (1 - \left( \frac{x}{\beta} \right)^{\frac{1}{\alpha}}) \) and \( 0 < \delta_1 \leq 1 \).

Similarly we get,

\[
\|I_4\| \leq \beta N_1 L_f(R) C_{1+\alpha} \int_0^{t_1} (t_1 - s)^{\beta - 1} \left[ (t_1 - s)^{-\beta \alpha} - (t_2 - s)^{-\beta \alpha} \right] ds
\]

\[
\leq \beta N_1 L_f(R) C_{1+\alpha} \delta_2 \alpha^{-1} (1 - c_1)^{-\beta(1-\alpha)-1} (t_2 - t_1)^{\beta(1-\alpha)},
\]

where \( c_1 = (1 - \left( \frac{x}{\beta} \right)^{\frac{1}{\alpha}}) \), \( 0 < \delta_2 \leq 1 \) and \( C_{1+\alpha} \) is some positive constant satisfying \( \|A^{\alpha+1} S(t)\| \leq C_{1+\alpha} t^{-1-\alpha} \) for all \( t \geq 0 \).
Thus the function $u$ satisfies a Hölder condition on $[0, t_0]$. With the help of the condition (A2), we can prove easily that the map $t \mapsto f(t, u(t))$ is Hölder continuous on $[0, t_0]$. This completes the proof of the theorem. □

4. Global existence

**Theorem 4.1.** Suppose that $0 \in \rho(-A)$ and $-A$ generates the analytic semigroup $S(t)$ with $\|S(t)\| \leq M$ for $t \geq 0$, $u_0 \in D(A)$ and the function $f : \{0, \infty \} \times X_u \to X$ satisfies the condition (A2). If there is a continuous nondecreasing real valued function $k(t)$ such that
\[
\|f(t, x)\| \leq k(t)(1 + \|x\|) \quad \text{for } t \geq 0, \ x \in X_u,
\]
then the fractional integral equation (1.1) has a unique solution $u$ which exists for all $t \geq 0$.

**Proof.** By Theorem 3.1, we can continue the solution of Eq. (1.1) as long as $\|u(t)\|_a$ stays bounded. It is therefore sufficient to show that if $u$ exists on $[0, T)$, then $\|u(t)\|_a$ is bounded as $t \uparrow T$.

For $t \in [0, T)$, we have
\[
A^a u(t) = \int_0^\infty \zeta_\beta(\theta) A^a S(t^\beta \theta) u_0 d\theta + \beta \int_0^t \int_0^\infty \theta (t-s)^{\beta-1} \zeta_\beta(\theta) A^a S((t-s)^\beta \theta) f(s, u(s)) d\theta ds.
\]
From the above equation we get
\[
\|u(t)\|_a \leq M \|u_0\|_a + \beta \int_0^t \int_0^\infty \theta (t-s)^{\beta-1} \zeta_\beta(\theta) \|A^a S((t-s)^\beta \theta)\| \|f(s, u(s))\| d\theta ds.
\]
Hence
\[
\|u(t)\|_a \leq C_1 + C_2 \int_0^t \int_0^\infty \theta (t-s)^{\beta(1-a)-1}\|u(s)\|_a d\theta ds,
\]
where $C_1 = M \|u_0\|_a + \frac{k(T)N_1 C_a T^\beta (1-a)}{(1-a)}$ and $C_2 = k(T) \beta N_1 C_a$. Hence from Lemma 6.7 [Chapter 5 in Pazy [13]], $u$ is a global solution.

To complete the proof of the theorem, we only need to show that $u$ is unique for the whole interval. Let $u_1$ and $u_2$ be two solutions of the given fractional integral equation (1.1). Then for any $t > 0$, we have
\[
\|u_1(t) - u_2(t)\|_a \leq \beta \int_0^t \int_0^\infty \theta (t-s)^{\beta-1} \zeta_\beta(\theta) \|A^a S((t-s)^\beta \theta)\| \|f(s, u_1(s)) - f(s, u_2(s))\| d\theta ds
\]
\[
\leq \beta N_1 C_a \int_0^t \int_0^\infty \theta (t-s)^{\beta(1-a)-1}\|u_1(s) - u_2(s)\|_a d\theta ds.
\]
Hence from Lemma 6.7 [Chapter 5 in Pazy [13]], the solution $u$ is unique. This completes the proof of the theorem. □

5. Approximate solutions

To prove the existence and convergence of approximate solutions to fractional integral equation we need additional conditions on $X$ and $A$.

We assume the following assumptions:

(A3) $X$ is a separable Hilbert space.

(A4) The operator $A$ is a closed, positive definite, self-adjoint linear operator from the domain $D(A) \subset X$ into $X$ such that $D(A)$ is dense in $X$. We assume $A$ has the pure point spectrum
\[
0 < \lambda_0 \leq \lambda_1 \leq \lambda_2 \leq \cdots \leq \lambda_m \leq \cdots,
\]
where $\lambda_m \to \infty$ as $m \to \infty$ and a corresponding complete orthonormal system of eigenfunctions $\{\phi_i\}$, i.e.,
\[
A \phi_i = \lambda_i \phi_i \quad \text{and} \quad \langle \phi_i, \phi_j \rangle = \delta_{ij},
\]
where $\delta_{ij} = 1$ if $i = j$ and zero otherwise.

If the conditions (A4) is satisfied then $-A$ is the infinitesimal generator of an analytic semigroup $\{S(t) : t \geq 0\}$ in $X$.

Let $X_n$ denote the subspace of $X$ generated by $\{\phi_0, \phi_1, \ldots, \phi_n\}$ and $P^n : X \to X_n$ be the associated projections operators. For $n = 0, 1, 2, \ldots$, we define the maps $F_n$ on $S$ as follows: for $u \in S$ and $t \in [0, T]$
\[
(F_n u)(t) = \int_0^\infty \zeta_\beta(\theta) S(t^\beta \theta) P^n u_0 d\theta + \beta \int_0^t \int_0^\infty \theta (t-s)^{\beta-1} \zeta_\beta(\theta) S((t-s)^\beta \theta) P^n f(s, P^n u(s)) d\theta ds.
\]
Theorem 5.1. Let $n \geq n_0$, where $n_0$ is large enough and $n, n_0 \in \mathbb{N}$, if the conditions (A2)–(A4) are satisfied then there exists a unique $u_n \in S$ such that $F_n u = u_n$ for each $n = 0, 1, 2, 3, \ldots$, i.e. $u_n$ satisfies the approximate integral equation

$$
    u_n(t) = \int_0^∞ \xi_ρ(θ) S(t^θ ρ)^n u_0dθ + β \int_0^t \int_0^∞ \theta(t-s)^β-1 \xi_ρ(θ) S((t-s)^θ ρ)^n f(s, P^n u_n(s))dθds.
$$

Moreover the solution $u_n$ is uniformly Hölder continuous on $[0, t_0]$.

**Proof.** With the help of Theorem 3.1, we can show easily that the mapping $F_n$ has a unique fixed point given by

$$
    u_n(t) = \int_0^∞ \xi_ρ(θ) S(t^θ ρ)^n u_0dθ + β \int_0^t \int_0^∞ \theta(t-s)^β-1 \xi_ρ(θ) S((t-s)^θ ρ)^n f(s, P^n u_n(s))dθds
$$

which is uniformly Hölder continuous on $[0, t_0]$. □

Corollary 5.2. If $u_0 \in D(A)$ then $u_n(t) \in D(A^n)$ for all $t \in [0, t_0]$, where $0 \leq η < 1$.

**Proof.** As the function, $u_n$, is Hölder continuous on $[0, t_0]$, hence with the help of Theorem 3.1, we can see that the map $t \mapsto P^n f(t, P^n u_n(t))$ is also Hölder continuous on $[0, t_0]$, hence $u_n \in D(A)$. Since $D(A) \subset D(A^n)$ and $u_n \in D(A)$ hence our Corollary is proved. □

Corollary 5.3. If $u_0 \in D(A)$ then there exists a constant $M_0$ independent of $n$ such that

$$
    \|A^n u_n\| \leq M_0,
$$

for all $t \in [0, t_0]$ and $0 \leq η < 1$.

**Proof.** From Eq. (5.3) we have,

$$
    u_n(t) = \int_0^∞ \xi_ρ(θ) S(t^θ ρ)^n u_0dθ + β \int_0^t \int_0^∞ \theta(t-s)^β-1 \xi_ρ(θ) S((t-s)^θ ρ)^n f(s, P^n u_n(s))dθds.
$$

Hence

$$
    \|A^n u_n(t)\| \leq M \|u_0\|_η + β \int_0^t \int_0^∞ \theta(t-s)^β-1 \xi_ρ(θ) \|A^n S((t-s)^θ ρ)\| \|P^n f(s, P^n u_n(s))\|dθds.
$$

$$
    \leq M \|u_0\|_η + N_1 C_η L(R)(T^\nu + R) + N_2 \frac{t^θ(1-η)}{(1-η)}
$$

This completes the proof of the Corollary. □

In order to prove the convergence, we need the following stronger assumption on the nonlinear map $f$ than (A2).

(A2′) The map $f$ is defined from $[0, ∞) \times X_ρ$ into $D(A^n)$ for $0 < η < 1$ and there exist a nondecreasing function $L$ from $[0, ∞)$ into $[0, ∞)$ such that

$$
    \|f(t, u) - f(s, v)\|_n \leq L(r)(|t-s|^{\nu} + \|u - v\|_u),
$$

for all $t, s \in [0, T], v \in (0, 1)$ and $u, v \in B_r(X_ρ)$, where $r > 0$.

Theorem 5.4. We choose $η$ such that $0 < α + η < 1$. If $u_0 \in D(A)$ and the assumptions (A2)–(A4) and (A2′) are satisfied then $\{u_n\} \subset S$ is a Cauchy sequence and therefore converges to a unique function $u \in S$.

**Proof.** Let $n \geq m \geq n_0$, where $n_0$ is large enough and $n, m, n_0 \in \mathbb{N}$. Hence from Theorem 5.1 we have

$$
    u_n(t) = \int_0^∞ \xi_ρ(θ) S(t^θ ρ)^n u_0dθ + β \int_0^t \int_0^∞ \theta(t-s)^β-1 \xi_ρ(θ) S((t-s)^θ ρ)^n f(s, P^n u_n(s))dθds.
$$

For $t \in [0, t_0]$, we have

$$
    \|A^n (u_n(t) - u_m(t))\| \leq \beta \int_0^t \int_0^∞ \theta(t-s)^β-1 \xi_ρ(θ) \|A^n S((t-s)^θ ρ)\| \|P^n f(s, P^n u_n(s)) - P^n f(s, P^n u_m(s))\|dθds.
$$
We have
\[
\|P^nf(s, P^n u_0(s)) - P^m f(s, P^m u_m(s))\| \leq \|P^n[f(s, P^n u_0(s)) - P^m f(s, P^m u_m(s))] + \| (P^n - P^m)[f(s, P^n u_0(s)) - f(s, P^m u_m(s))] \|
\]
\[
\leq \|P^n[f(s, P^n u_0(s)) - f(s, P^m u_m(s))]\| + \| (P^n - P^m)[f(s, P^n u_0(s)) - f(s, P^m u_m(s))] \|
\]
\[
\leq L(R)\|u_0(s) - u_m(s)\|_2 + L(R)\|A^{\alpha - \eta}(P^n - P^m)A^\alpha u_m(s)\|
\]
\[
+ \|A^{\alpha - \eta}(P^n - P^m)A^\alpha f(s, P^m u_m(s))\|.
\]
(5.8)

Let \( m < n \) then \( X_m \subset X_n \). Let \( X_m^\perp \) be the orthogonal complement of \( X_m \) for all \( m = 0, 1, 2, \ldots \), then \( X_m^\perp \supset X_n^\perp \). We can write
\[
X = X_m \oplus X_m^\perp = X_n \oplus X_n^\perp.
\]

Let \( z \in X \) be an arbitrary element. Then, we can write \( z = z_m + y_m \), where \( z_m \in X_m \) and \( y_m \in X_m^\perp \). Then, \( P^m z = z_m \in X_m \).

We can see easily that \( y_m \in X_m^\perp \Rightarrow y_m = \sum_{i=m+1} a_i \phi_i \), where \( y'_m \in X_m^\perp \). Let, \( \phi'_m = \sum_{i=m+1} a_i \phi_i \).

Hence, \( z = z_m + z'_m + y'_m \) and \( P^m z = z_m + z'_m \).

Therefore,
\[
P^m z - P^m z = z'_m = \sum_{i=m+1} a_i \phi_i.
\]

If, \( z = \sum_{i=1} a_i \phi_i \) then \( \|z\|^2 = \sum_{i=1} |a_i|^2 \).

Since, \( A^{\alpha - \eta} \phi_i = \lambda_i^{\alpha - \eta} \phi_i \) [16]. Hence, we have
\[
\|A^{\alpha - \eta}(P^n - P^m)z\|^2 = \left\langle A^{\alpha - \eta}(P^n - P^m)z, A^{\alpha - \eta}(P^n - P^m)z \right\rangle
\]
\[
= \left( \sum_{i=m+1} a_i \lambda_i^{\alpha - \eta} \phi_i, \sum_{i=m+1} a_i \lambda_i^{\alpha - \eta} \phi_i \right)
\]
\[
= \left( \sum_{i=m+1} a_i \lambda_i^{\alpha - \eta} \phi_i, \sum_{i=m+1} a_i \lambda_i^{\alpha - \eta} \phi_i \right)
\]
\[
= \sum_{i,m+1} a_i \lambda_i^{\alpha - \eta} \lambda_j^{\alpha - \eta} (\phi_i, \phi_j)
\]
\[
\leq \lambda_{m+1}^{2(\alpha - \eta)} \left( \sum_{i=m+1} |a_i|^2 \right)
\]
\[
\leq \frac{1}{\lambda_m^{2(\alpha - \eta)}} \|z\|^2.
\]

Therefore,
\[
\|A^{\alpha - \eta}(P^n - P^m)A^\alpha u_m(s)\| \leq \frac{1}{\lambda_m^{(\alpha - \eta)}} \|A^\alpha u_m(s)\|
\]
\[
\leq \frac{1}{\lambda_m^{(\alpha - \eta)}} M_0,
\]
(5.9)

where \( M_0 \) is same as in Corollary 5.3.

Now we use the inequality (5.9) and assumption (A2') in inequality (5.8) and get the following inequality
\[
\|P^nf(s, P^n u_0(s)) - P^m f(s, P^m u_m(s))\| \leq L(R)\|u_0(s) - u_m(s)\|_2 + L(R)\frac{M_0}{\lambda_m^{\alpha - \eta}} + C_1 \frac{M_0}{\lambda_m},
\]
(5.10)

where \( C_1 = \tilde{L}(R)[T' + R] + \|f(0, 0)\|_2 \) and \( \alpha < \eta < 1 \).

From inequality (5.10) and inequality (5.7), we get the following inequality
\[
\|A^\alpha[u_n(t) - u_m(t)]\| \leq L(R)\beta \int_0^t \int_0^\infty \theta(t-s)^{\beta-1}\zeta_\beta(\theta)\|A^\alpha S(\theta(t-s)^{\beta}\theta)\| \|u_n(s) - u_m(s)\|_2 d\theta ds
\]
\[
+ L(R)\frac{M_0}{\lambda_m^{\alpha - \eta}} \beta \int_0^t \int_0^\infty \theta(t-s)^{\beta-1}\zeta_\beta(\theta)\|A^\alpha S(\theta(t-s)^{\beta}\theta)\| d\theta ds
\]
\[
+ C_1 \frac{M_0}{\lambda_m^{\alpha - \eta}} \beta \int_0^t \int_0^\infty \theta(t-s)^{\beta-1}\zeta_\beta(\theta)\|A^\alpha S(\theta(t-s)^{\beta}\theta)\| d\theta ds.
\]
(5.11)

The first integral of the above inequality (5.11) can be estimated as follows
\[
L(R)\beta \int_0^t \int_0^\infty \theta(t-s)^{\beta-1}\zeta_\beta(\theta)\|A^\alpha S((t-s)^{\beta}\theta)\| \|u_n(s) - u_m(s)\|_2 d\theta ds
\]
\[
\leq \beta C_\alpha L(R)N_1 \int_0^t (t-s)^{\beta(1-\alpha)-1} \|u_n(s) - u_m(s)\|_2 ds.
\]
(5.12)
Second integral of the above inequality (5.11) is estimated as follows
\[
L(R) \frac{M_0}{\lambda_m^\alpha} \beta \int_0^t \int_0^\infty \theta (t - s)^{\beta - 1} \xi_\beta (\theta) \| A^\alpha s ((t - s)^\beta \theta) \| d \theta ds \leq \frac{c_a L(R) M_0 N_1}{\lambda_m^{n-\alpha}} t_0^{\beta(1-\alpha)}. \tag{5.13}
\]
Similarly third integral can be calculated as follows
\[
\frac{C_1}{\lambda_m^\alpha} \beta_1 \int_0^t \int_0^\infty \theta (t - s)^{\beta - 1} \xi_\beta (\theta) \| A^\alpha s ((t - s)^\beta \theta) \| d \theta ds \leq \frac{c_a C_1 N_1}{(1-\alpha) \lambda_m^\alpha} t_0^{\beta(1-\alpha)}. \tag{5.14}
\]
Finally, we deduce from the inequality (5.11) that
\[
\| A^\alpha [u_n(t) - u_m(t)] \| \leq \beta C_a L(R) N_1 \int_0^t (t - s)^{\beta(1-\alpha) - 1} \| u_n(s) - u_m(s) \| ds
+ \frac{c_a L(R) M_0 N_1}{(1-\alpha) \lambda_m^\alpha} t_0^{\beta(1-\alpha)}. \tag{5.15}
\]
The application of Gronwall’s inequality and adding \( m \to \infty \) to the above inequality gives the required result. This completes the proof of the theorem. \( \square \)

With the help of the Theorems 5.1, 5.4 and 4.1 we can state the following existence, uniqueness and convergence result.

**Theorem 5.5.** Let \( n \geq n_0 \), where \( n_0 \) is large enough and \( n, n_0 \in \mathbb{N} \). If the conditions (A2)–(A4) and (A2') are satisfying then there exist a unique \( u \in S \) such that \( u_0 \to u \) in \( S \) and \( u \) is given by Eq. (3.5).

**Proof.** We only need to prove that the limit \( u \) obtained above satisfies the integral equation (3.5). We have
\[
\| (P^n - I) u_0 \| \to 0, \quad \text{as} \quad n \to \infty. \tag{5.16}
\]
We also have
\[
\| P^n f(t, P^n u_n) - f(t, u(t)) \| \leq \| P^n - I \| f(t, P^n u_n(t)) \| + \| f(t, P^n u_n(t)) - f(t, u(t)) \|, \tag{5.17}
\]
where \( \| (P^n - I) f(t, P^n u_n(t)) \| \to 0 \) and \( \| f(t, P^n u_n(t)) - f(t, u(t)) \| \to 0 \), as \( n \to \infty \).

Therefore,
\[
\int_0^\infty \xi_\beta (\theta) S(t^\beta \theta) \| (P^n - I) u_0 \| d \theta + \beta \int_0^t \int_0^\infty \theta (t - s)^{\beta - 1} \xi_\beta (\theta) S(t^\beta \theta)
\times \| P^n f(s, P^n u_n(s)) - f(s, u(s)) \| d \theta ds \to 0 \quad \text{when} \quad n \to \infty. \tag{5.18}
\]
Hence from inequalities (5.16)–(5.18) we can see that \( u_n \) converges to \( u \) where \( u \) is given by Eq. (3.5). This completes the proof of the theorem. \( \square \)

6. Example

Let \( X = L^2((0, 1); \mathbb{R}) \). We consider the following fractional order integral equation,
\[
w(t, x) = w(0, x) + \frac{1}{\Gamma(\beta)} \int_0^t (t - \theta)^{\beta - 1} (\partial_\theta w(\theta, x)) d \theta + \frac{1}{\Gamma(\beta)} \int_0^t (t - \theta)^{\beta - 1} f(\theta, \partial_\theta w(\theta, x)) d \theta,
\]
w(t, 0) = w(t, 1) = 0, \quad t \in [0, T], \quad 0 < T < \infty, \tag{6.1}
\]
where \( F \) is a given sufficiently smooth function which satisfies the Hölder condition.

We define an operator \( A \).
\[
Au = -u'' \quad \text{with} \quad u \in D(A) = H_0^1((0, 1)). \tag{6.2}
\]

Here, clearly the operator \( A \) is self-adjoint, with compact resolvent and is the infinitesimal generator of an analytic semigroup \( S(t) \). We take \( \alpha = 1/2, D(A^{1/2}) \) is a Banach space with norm
\[
\| x \|_{1/2} \coloneqq \| A^{1/2} x \|, \quad x \in D(A^{1/2}),
\]
and we denote this space by \( X_{1/2} \).

The Eq. (6.1) can be reformulated as the following abstract equation in \( X = L^2((0, 1); \mathbb{R}) \):
\[
u(t) = u_0 + \frac{1}{\Gamma(\beta)} \int_0^t (t - \theta)^{\beta - 1} (-Au(\theta)) d \theta + \frac{1}{\Gamma(\beta)} \int_0^t (t - \theta)^{\beta - 1} f(\theta, u(\theta)) d \theta, \tag{6.3}
\]
where $u(t) = w(t, \cdot)$ that is $u(t)(x) = w(t, x), t \in [0, T], x \in (0, 1)$ and the function $f : [0, T] \times X_{1/2} \to X$ is given by

$$f(t, u(t))(x) = F(t, \partial_x w(t, x)).$$

(6.4)

We can take $f(t, u) = h(t)g(u')$, where $h$ is Hölder continuous and $g : X \to X$ is Lipschitz continuous on $X$. In particular we can take $g(u) = \sin u, g(u) = \xi u, g(u) = \arctan(u)$, where $\xi$ is constant.
